

**GOLIATH** is a new Tall Fescue variety to **CONQUER** the market. **GOLIATH** is an endophyte-free tall fescue, with good rust resistance. **GOLIATH** has a high nutritive value making this an excellent fall stockpiled feed.

Notable Characteristics

- Endophyte Free
- PERSISTANT
- Drought and Heat Tolerant
- High Feed Quality
- Excellent Regrowth
- Produces Large Amounts of Lush Forage

**Method of Seeding & Seeding Rates:**

Use a Brillion seeder, a no-till drill or broadcast followed by a culti-packer. Plant ¼” deep.

**New pasture:** 25-30 lbs. /acre

**Renovation/Overseeding existing pastures:** 15-20 lbs. /acre

**Grazing and Harvest Tips:**

**GOLIATH** is highly palatable; avoid over grazing. Graze at approximately 10-12 inches and remove animals when at 5-6 inches. **GOLIATH** is well adapted to many management schemes and growing conditions. As with any forage, management practices dictate the yield and quality of the forage nearly as much as the genetics of the product. With proper management practices, **GOLIATH** should provide high yielding, high quality forage that should result in improved producer profitability.

**Management Tips:**

**GOLIATH** is a deep-rooted, perennial grass that is productive, drought and heat tolerant. It is best suited to high fertility and heavy soils, withstanding acid, alkaline and poorly drained soils. Best growth is achieved during spring and fall seasons, with moderate growth during the summer season. Grazing control in spring should be more frequent in order to prevent seed head development. Seed heads can be removed by mowing. **Both endophyte free and novel endophyte varieties should not be over-grazed or harvested (closer than 5-6 inches) during the summer.** **GOLIATH** works well with white and red clover, as well as alfalfa. First harvest of hay should be cut in the late boot stage for high quality. Subsequent harvests can be made as growth permits. Fall stockpiling works extremely well with **GOLIATH**.
